

CLIENT: Williams Corporation – Williams Field Services Division,
Houma District

PROJECT: Overhauls, preventive maintenance, and call-out work.

Term of Contract – Project by Project
Total Horsepower – 50,000 mainline

PROJECT SUMMARY:

Preventive Maintenance Services has worked in the Houma district for Williams since 1997. Our entry to this area was for the contract overhaul of two Ingersoll-Rand KVT10 compressor units. We performed a top-end overhaul on one unit at Station 62 in Gibson, LA and a complete overhaul of one unit at Station 63 in Convent, LA.

Part of the work included alignment of the segmented cams on this unit, which are inherent in the design of this particular engine. PMSI has been very successful in alignment of these cams over the years so that the equipment runs smoother with less downtime. Our ability to align this cam system has created opportunity for us in several areas of the Gulf Coast. We are still working with the three plants in the Houma district.

We have performed work for other divisions of Williams, including TRANSCO and Texas Gas.
